## 1. EXECUTIVE SUMMARY

ExVul Web3 Security was engaged by **Junction** to review smart contract implementation. The assessment was conducted in accordance with our systematic approach to evaluate potential security issues based upon customer requirement. The report provides detailed recommendations to resolve the issue and provide additional suggestions or recommendations for improvement.

The outcome of the assessment outlined in chapter 3 provides the system's owners a full description of the vulnerabilities identified, the associated risk rating for each vulnerability, and detailed recommendations that will resolve the underlying technical issue.

### 1.1 Methodology

To standardize the evaluation, we define the following terminology based on OWASP Risk Rating Methodology [10] which is the gold standard in risk assessment using the following risk models:

- **Likelihood:** represents how likely a particular vulnerability is to be uncovered and exploited in the wild.
- **Impact:** measures the technical loss and business damage of a successful attack.
- **Severity:** determine the overall criticality of the risk.

Likelihood can be: High, Medium and Low and impact are categorized into: High, Medium, Low, Informational. Severity is determined by likelihood and impact and can be classified into five categories accordingly: Critical, High, Medium, Low, Informational shown in table 1.1.

		Informational	Low	Medium	High
Likelihood	High	INFO	MEDIUM	HIGH	CRITICAL
	Medium	INFO	LOW	MEDIUM	HIGH
	Low	INFO	LOW	LOW	MEDIUM
		IMPACT			

**Table 1.1 Overall Risk Severity**

To evaluate the risk, we will be going through a list of items, and each would be labelled with a severity category. The audit was performed with a systematic approach guided by a comprehensive assessment list carefully designed to identify known and impactful security issues. If our tool or analysis does not identify any issue, the contract can be considered safe regarding the assessed item. For any discovered issue, we might further deploy contracts on our private test environment and run tests to confirm the findings. If necessary, we would additionally build a PoC to demonstrate the possibility of exploitation. The concrete list of check items is shown in Table 1.2.

- **Basic Coding Bugs:** We first statically analyze given smart contracts with our proprietary static code analyzer for known coding bugs, and then manually verify (reject or confirm) all the issues found by our tool.
- **Code and business security testing:** We further review business logics, examine system operations, and place DeFi-related aspects under scrutiny to uncover possible pitfalls and/or bugs.
- **Additional Recommendations:** We also provide additional suggestions regarding the coding and development of smart contracts from the perspective of proven programming practices.

Category	Assessment Item
Basic Coding Assessment	<ul style="list-style-type: none"><li>• Apply Verification Control</li><li>• Authorization Access Control</li><li>• Forged Transfer Vulnerability</li><li>• Forged Transfer Notification</li><li>• Numeric Overflow</li><li>• Transaction Rollback Attack</li><li>• Transaction Block Stuffing Attack</li><li>• Soft Fail Attack</li><li>• Hard Fail Attack</li><li>• Abnormal Memo</li><li>• Abnormal Resource Consumption</li><li>• Secure Random Number</li></ul>

<b>Advanced Source Code Scrutiny</b>	<ul style="list-style-type: none"><li>• Asset Security</li><li>• Cryptography Security</li><li>• Business Logic Review</li><li>• Source Code Functional Verification</li><li>• Account Authorization Control</li><li>• Sensitive Information Disclosure</li><li>• Circuit Breaker</li><li>• Blacklist Control</li><li>• System API Call Analysis</li><li>• Contract Deployment Consistency Check</li><li>• Abnormal Resource Consumption</li></ul>
<b>Additional Recommendations</b>	<ul style="list-style-type: none"><li>• Semantic Consistency Checks</li><li>• Following Other Best Practices</li></ul>

**Table 1.2: The Full List of Assessment Items**

To better describe each issue we identified, we categorize the findings with Common Weakness Enumeration (CWE-699) [14], which is a community-developed list of software weakness types to better delineate and organize weaknesses around concepts frequently encountered in software development.

## 2. FINDINGS OVERVIEW

### 2.1 Project Info And Contract Address

Project Name	Audit Time	Language
Junction	2025-11-09	Solidity

#### Repository

N/A

#### Commit Hash

c371a689ecb08df505e7e1acb886d0fa8db140aa

#### 2.1.1 Deployed Contract Addresses

##### BSC

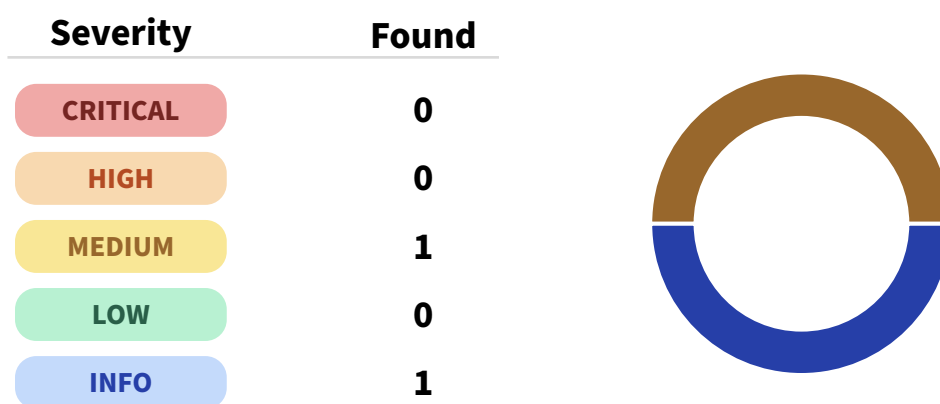

Name	Address
BurnMintERC20Upgrade	0xeA37A8DE1de2d9D10772EEB569e28Bfa5Cb17707
BurnMintTokenPool	0xdA1B1B3d3C97974B272E28f70F25Ab7c290e8357
TokenTransferor	0x4313d880Cc655Dc2e4f6d20819EC08f873B3B159

##### Ethereum

Name	Address
BurnMintERC20Upgrade	0xC477B6dfd26EC2460b3b92de18837Fd476Ea7549
BurnMintTokenPool	0x58e53cad56180743aCE00349Ef3E1BFE4EfF5732
TokenTransferor	0x2fetc3cd49C449bFd847C8f8D0F4e1E2f8669486

These addresses were supplied by the project team for audit scope confirmation.

## 2.2 Summary

2.3 Key Findings

Severity	Findings Title	Status
MEDIUM	Improper control of total supply	Acknowledge
INFO	Ambiguous error handling in address validation	Acknowledge

Table 2.3: Key Audit Findings

### 3. DETAILED DESCRIPTION OF FINDINGS

#### 3.1 Improper Control of Total Supply

**SEVERITY:****MEDIUM****STATUS:****Acknowledge****PATH:**`contracts/Token.sol::constructor()`**DESCRIPTION:**

In the `Token.sol` contract, the constructor does not validate that the initial supply (`preMint`) respects the configured maximum supply (`maxSupply_`). When `maxSupply_ != 0`, an overly large `preMint` can exceed the cap, risking over-issuance at deployment time.

Relevant Code Snippet:

```
constructor(
    string memory name,
    string memory symbol,
    uint8 decimals_,
    uint256 maxSupply_,
    uint256 preMint,
    address newOwner
) ERC20(name, symbol) {
    i_decimals = decimals_;
    i_maxSupply = maxSupply_;
    s_ccipAdmin = newOwner;
    // Mint the initial supply without cap validation
    if (preMint != 0) _mint(newOwner, preMint);
    grantMintRole(newOwner);
    grantBurnRole(newOwner);
}
```

**IMPACT:**

Over-issuance disrupts token economics, breaks supply guarantees, and may violate design or compliance constraints.

## RECOMMENDATIONS:

Validate `preMint` against `maxSupply_` when a cap is configured. If `maxSupply_ == 0`, treat supply as uncapped; otherwise, enforce `preMint <= maxSupply_`.

```
constructor(  
    string memory name,  
    string memory symbol,  
    uint8 decimals_,  
    uint256 maxSupply_,  
    uint256 preMint,  
    address newOwner  
) ERC20(name, symbol) {  
    // ...  
+   require(maxSupply_ == 0 || preMint <= maxSupply_, "preMint exceeds  
    max supply");  
    if (preMint != 0) _mint(newOwner, preMint);  
    // ...  
}
```

### 3.2 Ambiguous Error Handling in Address Validation

**SEVERITY:**

INFO

**STATUS:**

Acknowledge

**PATH:**`contracts/Token.sol::validAddress modifier`**DESCRIPTION:**

The `validAddress` modifier rejects transfers to invalid recipients (e.g., the zero address or current contract) but reverts without a clear, custom error. This makes debugging and downstream integration harder and produces inconsistent revert semantics.

**IMPACT:**

Reduced diagnosability for integrators and off-chain tooling; inconsistent revert reasons across validation paths.

**RECOMMENDATIONS:**

Introduce a custom error and use it in the `validAddress` modifier (and similar checks) to provide explicit failure reasons.

```
+error InvalidRecipientAddress();

modifier validAddress(address to) {
-   require(to != address(0) && to != address(this));
+   if (to == address(0) || to == address(this)) revert
    InvalidRecipientAddress();
    -;
}
```

## 4. CONCLUSION

In this audit, we thoroughly analyzed **Junction** smart contract implementation. The problems found are described and explained in detail in Section 3. The problems found in the audit have been communicated to the project leader. We therefore consider the audit result to be **PASSED**.

To improve this report, we greatly appreciate any constructive feedbacks or suggestions, on our methodology, audit findings, or potential gaps in scope/coverage.

## 5. APPENDIX

### 5.1 Basic Coding Assessment

#### 5.1.1 Apply Verification Control

<b>Description</b>	The security of apply verification
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

#### 5.1.2 Authorization Access Control

<b>Description</b>	Permission checks for external integral functions
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

#### 5.1.3 Forged Transfer Vulnerability

<b>Description</b>	Assess whether there is a forged transfer notification vulnerability in the contract
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

#### 5.1.4 Transaction Rollback Attack

<b>Description</b>	Assess whether there is transaction rollback attack vulnerability in the contract
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

#### 5.1.5 Transaction Block Stuffing Attack

<b>Description</b>	Assess whether there is transaction blocking attack vulnerability
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

#### 5.1.6 Soft Fail Attack Assessment

<b>Description</b>	Assess whether there is soft fail attack vulnerability
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

### 5.1.7 Hard Fail Attack Assessment

<b>Description</b>	Examine for hard fail attack vulnerability
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

### 5.1.8 Abnormal Memo Assessment

<b>Description</b>	Assess whether there is abnormal memo vulnerability in the contract
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

### 5.1.9 Abnormal Resource Consumption

<b>Description</b>	Examine whether abnormal resource consumption in contract processing
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

### 5.1.10 Random Number Security

<b>Description</b>	Examine whether the code uses insecure random number
<b>Result</b>	Not found
<b>Severity</b>	<b>CRITICAL</b>

## 5.2 Advanced Code Scrutiny

### 5.2.1 Cryptography Security

<b>Description</b>	Examine for weakness in cryptograph implementation
<b>Result</b>	Not found
<b>Severity</b>	<b>HIGH</b>

### 5.2.2 Account Permission Control

<b>Description</b>	Examine permission control issue in the contract
<b>Result</b>	Not found
<b>Severity</b>	<b>MEDIUM</b>

### 5.2.3 Malicious Code Behavior

<b>Description</b>	Examine whether sensitive behavior present in the code
<b>Result</b>	Not found
<b>Severity</b>	<b>MEDIUM</b>

### 5.2.4 Sensitive Information Disclosure

<b>Description</b>	Examine whether sensitive information disclosure issue present in the code
<b>Result</b>	Not found
<b>Severity</b>	<b>MEDIUM</b>

### 5.2.5 System API

<b>Description</b>	Examine whether system API application issue present in the code
<b>Result</b>	Not found
<b>Severity</b>	<b>LOW</b>

## 6. DISCLAIMER

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to the Company in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes without ExVul's prior written consent.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts ExVul to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model or legal compliance.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. ExVul's position is that each company and individual are responsible for their own due diligence and continuous security. ExVul's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies, and in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## 8. About Exvul Security

### Premier Security for the Web3 Ecosystem

ExVul is a premier Web3 security firm committed to forging a secure and trustworthy decentralized ecosystem. Our elite team consists of security veterans from world-leading technology and blockchain security firms, including Huawei, YBB Captical, Qihoo 360, Amber, ByteDance, MoveBit, and PeckShield. Team member Nolan is ranked as a top-40 whitehat on Immunefi and is the platform's sole All-Star in the APAC region.

Our expertise covers the full spectrum of Web3 security. We conduct **meticulous smart contract audits**, having fortified thousands of projects on chains like Evm, Solana, Aptos, Sui etc. Our **Blockchain Protocol Audits** secure the core infrastructure of L1/L2 by uncovering deep-seated vulnerabilities. We also offer **comprehensive wallet audits** to protect user assets and provide **proactive web3 pentest**, enabling partners to neutralize threats before they strike.

Trusted by industry leaders, ExVul is the security partner for **OKX, Bitget, Cobo, Infini, Stacks, Aptos, Sui, CoreDAO, Sei** etc.
